

*Dear Editor,*

*Global warming is an issue, and it's a more serious issue than most. Also, it's not just happening. There is a cause, and it's us. We caused global warming from all those aerosol cans that had harmful toxins. Those toxins tore a hole in the ozone layer which deflects the harmful rays of the sun. With the hole in the ozone layer those harmful rays warm the globe considerably in a few years. Also since the globe is warming so is the polar ice caps which means more water. More water and warmer air currents also mean bigger and more severe hurricanes. But there's more. The tsunami in Asia was also caused by global warming. Another reason aside from those is the animals. With it getting warmer the animals that live in cool climates might die. Likewise, the animals in Antarctica might die because of a lack of fish, ice, and land.*

*Sincerely,*

*Trey Clark*
